

Peruvian Conference on Scientific Computing

October 3 - 6, 2022

Universidad Nacional de San Antonio Abad del Cusco
Cusco - Perú

Topics of Interest

- Modelling, Simulation & Optimisation
- Computational Fluid Dynamics
- Subsurface Flows
- Mathematical Epidemiology
- Climate and Environmental Topics
- Finite Elements

Invited Speakers

- Roland Becker (Univ. Pau, France)
- Erik Burman (UCL - London, UK)
- Omar Ghattas (Univ. of Texas at Austin, USA)
- Roxana Lopez-Cruz (UNMSM, Lima, Perú)
- Insa Neuweiler (Univ. of Hannover, Germany)
- Olga Vasilieva (Univ. del Valle, Colombia)

Contents

1	Welcome	7
2	Time table	10
3	Key Lectures	13
3.1	Adaptive finite element methods for parameter estimation problems	14
3.2	Stabilised finite element methods for ill-posed problems with conditional stability	15
3.3	Implications of the delayed Feedback effect on the stability of a SIR epidemic model	16
3.4	Geometric Deep Neural Network Surrogates for Bayesian Inverse Problems	17
3.5	Multi-rate mass-transfer models for flow and transport in heterogeneous porous media	18
3.6	Male-biased releases of <i>Wolbachia</i> -carrying mosquitoes for dengue control	19
4	Talks	21
4.1	Shifted-dipole magnetic fluids: effect of the dipolar shift on the arrested chain growth and their microstructure	22
4.2	Male-biased releases of <i>Wolbachia</i> -carrying mosquitoes for dengue control	23
4.3	Aggregation of active superparamagnetic colloidal particles in strong magnetic field using Brownian dynamics simulation. . .	24

4.4	Implementation of control strategies in spatial dynamics using sterile insect techniques	25
4.5	Assembly of colloidal magnetic Janus particles in an external uniform magnetic field	26
4.6	A degenerating convection-diffusion system modelling froth flotation with drainage	27
4.7	An a posteriori error estimator for an incompressible elasticity problem with mixed boundary conditions	29
4.8	Modeling the Wolbachia imperfect maternal transmission in <i>Aedes aegypti</i> mosquitoes	31
4.9	Obtaining Master Curves in Extremely Bidisperse Magnetorheological Fluids Using MATLAB	32
4.10	Modelling ACL in PEMWEs using a multiscale method	33
4.11	High Relative Accuracy Computing with Matrices Appearing in Computer Aided Geometric Design	35
4.12	Embedded Boundaries with Higher Order Accuracy for Geophysical Applications	37
4.13	Local problems for stabilizing the convection-diffusion-reaction equation	38
4.14	QRDOM with FEM for anisotropic transport problems	40
4.15	Richards model for simulations of water infiltration in agricultural soil using DuMu ^x	41
4.16	A microstructural and magneto-mechanical study of a magnetic colloidal suspension of interacting magnetic particles in the presence of an external magnetic field using Brownian dynamics simulations	42
4.17	The influence of solver tolerances on large scale coupled climate simulations	44
4.18	Scientific computing with deep generative models	45
4.19	A Semi-smooth Newton Method for Regularized L^q -quasinorm Sparse Optimal Control Problems	46
4.20	A priori and a posteriori error estimates for the Deep Ritz method applied to the Laplace and Stokes problem	47
4.21	Complementarity problems and applications	48
4.22	Numerical solution of the equations of motion of magnetic nanoparticles used in biomedicine in the bloodstream, using Brownian molecular dynamics.	49
4.23	On the approximation of the wave equation operator using deep learning	50
4.24	Simulation of the behaviour of covid-19 with the stochastic SIR model: case of Perú	51

4.25	Application of finite element method coupled with artificial neural network for simulating seepage in earth dams	52
4.26	Dengue control by releasing sterile male mosquitoes	53
4.27	A glimpse at variational inequalities and the obstacle-type problem	54
4.28	Systematization of quaternion approach as a singularity-free model to track orientation dynamics of rigid bodies: Application to simulation of colloids composed by anisotropic particles.	55
4.29	Pressure post-processing for the continuous Galerkin-Petrov space-time discretization of the nonstationary Stokes problem	56
4.30	Efficient positivity/bound preserving schemes for complex nonlinear systems	58
4.31	Multirate Adaptive Time-stepping Schemes for Coupled Systems of PDEs	59
4.32	Principal Geodesic Analysis in Director-Based Dynamics of Hybrid Mechanical Systems	59
4.33	Real-Time Contactless Breathing Monitoring System Using Radar with Web Server	61
4.34	Improving the computational performance of the IRKA method	62
4.35	Large-scale simulation of single-phase flow in 3D fractured porous media using a mixed hybrid FEM	63
4.36	Data assimilation by TPU for Ocean Circulation Model . . .	66
4.37	Doubly enriched finite volume spaces for the DNS of fluid-particle interaction	67
5	Poster	68
5.1	Existence of weak solution for a non-linear parabolic problem with fractional derivatives	69
5.2	Aplicación de modelos matemáticos para estimar la estabilidad del nivel del agua en un sistema de dos tanques en serie con variaciones en la demanda del servicio	70
5.3	Duality theory of Convex Analysis: An application to the complete electrode model	72
5.4	Statistical analysis to estimate the spatial variation in sediment fluxes in a limited data context. Case of study: Peruvian western Andes	73
5.5	Modelo matematico de la tuberculosis asociada a factores socioeconomicos en la ciudad de Cali, Colombia	74

5.6	Analysis of third order linear analytic differential equations with a regular singularity: Bessel and other classical equations	75
5.7	Remote sensing air quality analysis of Peru based on PM2.5 values	79
5.8	Análisis de la realidad del fútbol de menores en Lima-Perú	80
5.9	Problema mixto en 1D para la ecuación de Poisson con condiciones de contorno Neumann puro	81
5.10	An approach to calculate a preconditioned basis separator in an interior point method	83
5.11	ANN application to one-dimensional inverse transport problems	84
5.12	Virtualization of scientific software based on Arch Linux in GitPod	85
5.13	Simulation of fluid dynamics and CO ₂ gas exchange in the alveolar sacs of the human lung	86
5.14	Exploring parameter spaces in Holomorphic Dynamics	87
5.15	Morphodynamics neuroscience. A computational approach to dendritogenesis of pyramidal cells in the developing olfactory cortex	88
5.16	Regiones de Voronoi para optimizar geoespacialmente los puntos de recarga para vehículos eléctricos, una propuesta para Bogotá D.C.(Colombia)	90
5.17	The Inexact Restoration Method applied to the Minimization problems with orthogonality constraints	92
5.18	Inferential model from machine learning based on health data mental Colombia compared to the world level	94
5.19	Effect of microstructure on the magnetization of a suspension of magnetic Janus particles	95
5.20	Differential equations applied to viral diseases	95
5.21	Mathematical model of a predator-prey food chain: plankton-anchovy	97
5.22	Small Satellites as platforms for Engineering Education	99
5.23	Modelo estadístico para la abundancia del estadio de huevos de la Diaphorina Citri	100

QRDOM with FEM for anisotropic transport problems

Pedro H.A. Konzen¹ Leonardo F. Guidi² Thomas Richter³

It is consider the numerical simulation of one group neutron transport problems in anisotropic media in rectangular domains. Such problems can be modeled by an integral-differential equation, and one of the most widely used techniques to solve it is known as the Discrete Ordinates Method (DOM). It consists in approximating the integral term by using an appropriate quadrature set, which leads to a system of partial differential equations. It is well known that the DOM approximation may produce unrealistic oscillatory solutions known as the ray effects. As an alternative, it is presented the Quasi-Random Discrete Ordinates Method (QRDOM), which preserves the main characteristics of the DOM, but it has the advantage of providing approximate solutions with mitigated ray effects. Its central idea is to explore a quasi-Monte Carlo integration within the classical source iteration technique. Through the discussion of benchmark problems, we present the advantages and disadvantages of the application of the QRDOM with finite element discretization. As well, we point its potential further applications to more complex particle transport problems.
